

### Human Female Reproductive System

Number	Organ Name	Organ Function
1	Ovary	Site where eggs are produced as well as estrogen (secondary sex characteristics)
2	Fallopian tube (oviduct)	Where egg is released into after ovulation and this is also the site of fertilization
3	Uterus	Muscular organ where the embryo attaches and develops (placenta develops from wall of uterus)
4	Cervix	Physical barrier between vagina and the uterus
5	Vagina	First site where sperm enters the female reproductive tract (moist to allow sperm to survive and swim) *also the birth canal
6	Urinary bladder	Temporary storage of urine
7	Urethra	Transports urine only out of the body
